(a) one momentum, pole at $\varepsilon_q = 2.494$ on the band
window set by the data precision $10^{-12}$: $n \le 140$
window set by the output level $\mu = 0.4$: $n \le 20$
data: $|\hat{g}_n(\lambda_1)|$, $\lambda_1 = 0.2$
continued to $\delta = 0$: $|e^{\alpha\lambda_1 n}\hat{g}_n(\lambda_1)|$
magnitude
Fourier index $n$
(b) its spectral function at $\delta = 0$ from the windowed series
window $n \le 20$
window $n \le 140$
exact: $\delta(\varepsilon - \varepsilon_q)$
$A(\varepsilon)$ at $\delta = 0$
$\varepsilon$
